code, this code should be a joy to play with, but im not sure how i should get this code to read a character from a file? A: Does your file have a single name per line? If so, you'll want to read in the file one line at a time. Otherwise, you'll want to check for the at the end of each line. You can do this with string.Split(), and the Line.Equals method. string[] lines = File.ReadLines(filename); foreach (string line in lines) { // The line may have a newline on it... string[] chars = line.Split(' '); if (line.Equals("name")) { // load the name and determine if it's valid } if (line.Equals("age")) // load the age and determine if it's valid } Something like that anyway. You'll have to decide how to load the age, and possibly decide if a valid name is "Unspecified". This article has been cited by 1 publications. This citation may be outdated. Cite this article as: Pons, A., P. Mondragon, and R. Blanco (2019), Understanding gender differences in medical practice: A systematic review, Integrative Nursing, 13(3). How to Cite this Article: Pons, A., P. Mondragon, and R. Blanco. 2019. Understanding gender differences in medical practice: A systematic review, Integrative Nursing, 13(3):1–18. Download DOI : Abstract A systematic review of qualitative and quantitative studies, published between 1990 and 2017, that examined the roles of gender in medical practice and the reasons why men and women took on different medical roles was conducted. Two databases were searched: PubMed and CINAHL. A total of 16,103 articles were identified by the search strategy, from which 46 articles were 82157476af
